

LLM + Hermes Agent for Homeopathy: Comprehensive Benefits

Generated for OOREP local repertory project — N.D. Walker Kirkpatrick

1. Conversational Repertory Interface

- Natural-language rubric search** — describe the symptom in plain clinical language ("patient chokes when swallowing saliva, larynx feels cold"); Hermes translates to rubrics via your vector index.
- Graduated rubric exploration** — ask "what's underneath this rubric?" and get parentchild hierarchy, remedy counts, and cross-references without clicking through tiers.
- Multi-remedy comparison on the fly** — "show me where Bromum and Hepar sulph overlap and diverge" with instant table generation.
- Antidote / complementary / follow-up remedy lookup** via local materia medica embeddings.
- Cross-reference repertory editions** — compare your local OOREP snapshot against another edition if both are indexed.
- Abbreviation decoding** — "what remedy is Calc-sil?" with disambiguation (Calcarea silicata vs. Silico-calcarea).

2. Cross-Session Patient Memory

- Persistent case context** — Hermes remembers Mrs. J.'s last prescription, potency, Supine Modality trigger, and response across weeks without manual file-hunting.
- Chronic case timelines** — timeline generation of prescriptions, aggravations, and ameliorations ("plot Mrs. J.'s headache severity since June 1").
- Patient-specific pattern recognition** — alert when a new symptom cluster rhymes with an old case ("similar presentation to Mr. K. last spring; Lycopodium worked there").
- Family constellations** — track tendencies across family members loaded in memory.
- Suppression history awareness** — reminders of previous suppressive treatments or surgeries that shape the case.

3. Differential Diagnosis & Remedy Selection

- Weighted repertorization dialogue** — enter symptoms interactively; watch the remedy ranking update live as you add/remove rubrics.
- Strange-rare-peculiar (SRP) flagging** — Hermes surfaces SRP symptoms from the intake and weights them automatically in your ranking.
- Keystone triangulation** — "which remedy has hoarseness + parotid swelling left + icy cold forearm?" converted to a weighted multi-rubric query.
- Elimination analysis** — given a shortlist, ask "what symptom would rule out Phosphorus here?" and get logic based on materia medica absence.
- Potency and repetition guidance** — based on remedy characteristics and patient vitality indicators stored in memory.
- Acute vs. chronic layer separation** — Hermes tags symptoms by layer and prevents inappropriate chronic remedies in acute presentations.

4. Materia Medica & Learning

- On-demand proving summaries** — "give me the mental-emotional picture of Medorhinum" synthesized from your offline materia medica + OOREP weightings.
- Remedy relationships tutoring** — interactive Q&A about complementary, antidotal, and inimical relationships with clinical context.
- Source material tracing** — every summary cites which proving/author it draws from, linked to your local library.
- Comparative materia medica** — "Bromium vs. Iodum vs. Chlorum" — elemental halogen remedy triad deep-dives.
- Kingdom / family / group analysis** — "show me the Spiders" or "Mineral column 6" with symptom overlays.
- Clinical tip extraction** — mine your past successful cases for unpublished "what worked in practice" insights.

5. Pattern Discovery & Research

- Rubric co-occurrence mining** — "what remedies appear in both 'fear of high places' and 'waking at 3 AM'?" reveals unexpected polycrestes.
- Severity-weighted trending** — detect rising rubric-remedy weights over time if you index updated provings.
- Patient-cohort analysis** — "of all my Pulsatilla patients, what follow-up remedy was most common?" using anonymized local data.
- Phantom rubric detection** — flag rubrics that always return the same 3 remedies regardless of query, suggesting poor differentiation.
- Botanical repertory cross-mapping** — bridge materia medica entries between homeopathic and herbal/botanical taxonomies via WHO Monograph IDs.
- Genomic-modality hypothesis generation** — "if linked to metabolic SNP data, surface 'slow COMT patients respond strongly to Sulphur' hypotheses for further testing."

6. Automated Documentation & SOAP

- Voice-to-rubric intake** — dictate the case during the visit; Hermes transcribes and suggests rubrics in real time via your Blue Snowball.
- SOAP auto-assembly** — Hermes generates draft Subjective/Objective/Assessment/Plan from your conversational case notes.
- Prescription audit trails** — automatic structured logging: remedy, potency, date, rationale rubrics, confidence level.
- Follow-up scheduling with context-aware prompts** — cron job pings you at 4 weeks with "check headache modality and sleep position since last Lac can."
- Letter generation** — referral letters, school/work absence notes with homeopathic framing, automatically drafted.

7. Multi-Agent & Delegation Workflows

- Rubrics agent + Materia medica agent + Strategy agent** — delegate parallel tasks: Agent A builds the repertorization, Agent B researches the top remedy's toxicology, Agent C checks for drug interactions.
- Literature-review agent** — continuously monitors PubMed / homeopathic journals and surfaces new provings relevant to your active cases (cron-scheduled).
- Case-supervision agent** — a "second opinion" subagent that re-repertorizes from scratch and flags blind spots in your original analysis.
- Student-training agent** — for teaching clinics, a separate agent persona poses as a simulated patient while you repertorize, then debriefs.

8. Data Engineering & Repertory Maintenance

- Automated remedy-picture freshness** — detect when new provings or clinical reports should update your local remedies.json corpus.
- Rubric gap analysis** — identify symptoms from your patient population that map poorly to existing rubrics, suggesting where the repertory is thin.
- Custom rubric creation** — for rare or newly-proved symptoms, add private rubrics to your local SQLite that feed into repertorization alongside OOREP publicum.
- Vector index rebalancing** — automated rebuilds of your hashed-bow-cosine index when rubrics.json updates.
- Backup & sync verification** — cron jobs that push encrypted repertory snapshots to your private GitHub and verify integrity.

9. Teaching, Exam Prep & Community

- Materia medica flashcard generation** — from your local remedy repository, spaced repetition via cron.
- Clinical vignette quizzes** — Hermes generates case scenarios, scores your repertorization against OOREP weights, and explains the logic.
- Kent-method vs. Boenninghausen-method comparison mode** — run the same case through both filters and compare outputs.
- Remedy-personality storytelling** — leverage your 50-remedy personality engine to narrate remedies as characters for teaching children or lay audiences.
- Grand rounds synthesis** — aggregate multiple cases of the same remedy into a composite teaching narrative.

10. Safety, Privacy & Clinical Guardrails

- PH-minimizing mode** — Hermes knows your preference and strips identifying details from logs, prompts, and tool traces.
- Practitioner-override enforcement** — every prescription recommendation pauses for your approval before being recorded or communicated.
- Red-flag symptom detection** — if an intake contains "sudden vision loss + thunderclap headache," Hermes flags the need for allopathic referral regardless of repertory analysis.
- Contraindicated remedy alerts** — warn if a suggested remedy belongs to a family the patient has previously reacted poorly to (from cross-session memory).
- Audit logging for licensure** — immutable timestamped records of who suggested what, when, and on what rubric basis.
- Offline resilience** — the entire stack (OOREP + vector search + materia medica) functions without internet; cloud is a convenience, not a dependency.

Meta-Capability: The System Learns You

- Skill accumulation** — after each complex case, Hermes saves the workflow as a skill ("Chronic parotitis with left-sidedness: Bromum selection logic"); next time a similar case arrives, it loads automatically.
- Personality-aware reasoning** — Hermes adopts the remedy-personality lens (e.g. Pulsatilla for child cases, Bryonia for adult acute) to color its questioning style and tutoring tone.
- Model routing intelligence** — delegate heavy vector searches to your local Jetson and deep reasoning to cloud Kimi; smart routing preserves battery and latency.
